Abstract
An enantiocontrolled synthesis of the monocyclic bisabolene-type sesquiterpenoids (+)-curcuquinone 1 and (-)-curcuhydroquinone 2 has been accomplished using a porcine pancreatic lipase (PPL)-mediated desymmetrization of the prochiral σ-symmetrical 2-aryl-1,3-propanediol 6 as the key reaction step.

Keywords: Sesquiterpene, curcuquinone, curcuhydroquinone, lipase, enantioselective synthesis

Introduction
Curcuquinone (1) and curcuhydroquinone (2) are two aromatic bisabolene sesquiterpenoids isolated from the Caribbean gorgonian Pseudopterogorgia rigida by Fenical et al.1 and are responsible for its antibiotic properties. Although several syntheses of these terpenoids as the racemic forms2 have been published, very few synthetic reports on the optically active forms3 are available. In particular, the enantioselective synthesis of the natural enantiomer has never been reported. Given the biological profile of these terpenoids and also their versatility as chiral building blocks for constructing biologically important natural products, e.g., heliannuol A and D,3a the development of an efficient and enantioselective synthetic route is of significant value. In this paper, we report an enantiocontrolled synthesis of the natural enantiomers of 1 and 2 (Figure 1).

Our basic strategy is shown in Scheme 1. We envisaged preparing the target molecules from the curcuhydroquinone dimethyl ether (3), which would be derived from the sulfone (4) via a sequential prenylation and desulfonylation. The pivotal construction of the benzylic tertiary stereogenic center with the R configuration in 5 would be realized by employing the lipase-
mediated desymmetrization\textsuperscript{3a,4} of the prochiral \(\sigma\)-symmetrical 2-aryl-1,3-propanediol (6) (Scheme 1).

\section*{Results and Discussion}

Preparation of a \(\sigma\)-symmetrical 2-aryl-1,3-propanediol (6) as the substrate of chemo-enzymatic desymmetrization began with the Heck reaction\textsuperscript{5} of the iodide (7)\textsuperscript{6} with the cyclic acetal (8)\textsuperscript{5a} to give the coupled product (9) in 90\% yield. Ozonolytic cleavage of the double bond, followed by reductive workup with NaBH\(_4\), provided the desired diol (6) in 87\% yield (Scheme 2).

With the requisite diol in hand, we examined optimum conditions for its conversion into the optically active monoacetate (5) using a wide variety of lipases. Of these, porcine pancreatic lipase (PPL)-mediated transesterification of the prochiral diol (6) in diethyl ether, using vinyl acetate as an acetyl donor, provided 5 in 41% yield (94% yield based on the consumed 6 with 78% ee (HPLC on a Chiralcel OJ column). Although the absolute configuration of the stereogenic center could not be determined at this stage, it was established to be R- by the eventual conversion to the natural curcuhydroquinone (2). Alternatively, the (S)-monoacetate (5) was obtained by transesterification using CAL or lipase PS-C in diethyl ether as shown in Scheme 3.

The (R)-monoacetate thus obtained was then tosylated and reductively deoxygenated with NaBH₄ in hot DMSO to give the alcohol (11) after reductive treatment with LiAlH₄. Fortunately, it was obtained as a crystalline solid and recrystallization from hexane gave the optically pure 11 in 71% overall yield for the three steps. Sequential Hata reaction⁷ and m-CPBA oxidation of the resulting sulfide (12) gave the sulfone (13) in 82% yield. Treatment of 13 with n-BuLi-HMPA and prenyl bromide yielded the carbon-elongated sulfone (4), which was reduced with 5% Na–Hg under sonication to provide 3 in 83% yield for the two steps. Oxidation of 3 with ceric ammonium nitrate in aqueous acetonitrile furnished curcuquinone (1) in 56% yield, [α]₀ +1.47° (c 2.8, CHCl₃); [α]₀ +4.32° (c 2.8, CHCl₃) {lit.¹ [α]₀ -1.3° (c 9.1, CHCl₃); for the enantiomer,³ [α]₀ -0.9° (c 1.0, CHCl₃)}, which was reduced with sodium dithionite in aqueous THF to cleanly provide curcuhydroquinone (2), [α]₀ -48° (c 2.8, CHCl₃) {lit.¹ [α]₀ -21° (c 0.9, CHCl₃); lit.¹ [α]₀ -34° (c 0.93, CHCl₃)} in 98% yield. The spectroscopic properties of synthetic 1 and 2 were identical with those of the natural products (Scheme 4).
Conclusions

We have accomplished the first enantioselective synthesis of (+)-curcuquinone (1) and (-)-curcuhydroquinone (2) employing a PPL-mediated transesterification of a prochiral \( \sigma \)-symmetrical 2-aryl-1,3-propanedioi as the key reaction step. We also demonstrated that enantiomeric analogs can be prepared by the chemo-enzymatic desymmetrization protocol. The synthetic route shown here is general and efficient, and can also be applied to the synthesis of other related terpenoids.

General Procedures. \(^1\)H NMR were measured in CDCl\(_3\) solution and referenced to TMS (0.00 ppm) using JEOL JMS FX-200 (200 MHz), JEOL GSX-400 (400 MHz), Bruker ARX 400 (400 MHz) and JEOL AL 400 (400 MHz) spectrometers, unless otherwise noted. \(^13\)C NMR were measured in CDCl\(_3\) solution and referenced to CDCl\(_3\) (77.0 ppm) or TMS (0.00 ppm) using JEOL AL 300 (75 MHz), JEOL GSX-400 (100 MHz), Bruker ARX 400 (100 MHz) and JEOL AL 400 (100 MHz) spectrometers. Chemical shifts are reported in ppm (from TMS). When peak multiplicities are reported, the following abbreviations are used: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broadened. IR spectra were recorded on Perkin Elmer 1720 FT-IR,
Hitachi 215 and JASCO FT/IR-410 spectrophotometers. MS spectra were obtained on JEOL JMS-DX303, JMS-AX500 and JMS-SX102A. Elemental analyses were performed with a Yanaco MT-3 CHN-Corder. Optical rotations were determined on JASCO P-1010. Analytical thin layer chromatography (TLC) was performed on precoated plates (0.25 mm, silica gel Merck 60F245), and compounds were visualized with UV light and p-anisaldehyde stain. Column chromatography was performed on a silica gel, KANTO Silica Gel 60 N (63-210 mesh). Melting points were measured with a Yanaco MP-500D melting point apparatus and are uncorrected. All reactions were performed in oven-dried glassware under a positive pressure of argon or nitrogen, unless otherwise noted. “RT” denotes room temperature.

2-tert-Butyl-6-(2,5-dimethoxy-4-methylphenyl)-4,5-dehydro-1,3-dioxepane (9). A mixture of 7 (20 g, 72 mmol), 8 (12.8 mL, 86 mmol), i-Pr2NEt (38 mL, 216 mmol), Pd(OAc)2 (0.48 g, 2.2 mmol) and Ph3P (1.2 g, 4.3 mmol) in DMF (60 mL) was stirred at 80 °C for 13 h. After removal of the solvent, the residue was extracted with benzene and the extracts were washed with water and brine, and dried over MgSO4. Evaporation of the solvent, followed by chromatography on silica gel (hexane–ethyl acetate, 95:5, v/v) gave 9 (19.8 g, 90%) as a yellow oil.

(6S)-6-(2,5-Dimethoxy-4-methylphenyl)-2-methyl-5-phenylsulfonyl-2-heptene (4). To a solution of 13 (1.2 g, 3.6 mmol) and HMPA (4.8 mL) in THF (15 mL) was added dropwise n-BuLi (1.61 M in hexane solution, 3.4 mL, 5.4 mmol) at -78$^\circ$C and stirred for 30 min. The mixture was further stirred at 0$^\circ$C for 30 min and cooled to -78$^\circ$C. A solution of 4-bromo-2-methyl-2-butene (1.2 mL, 10.8 mmol) in THF (10 mL) was added and stirred for 30 min at the same temperature. The reaction mixture was quenched by the addition of sat. aq. NH$_4$Cl and extracted with CH$_2$Cl$_2$. The extracts were washed with brine, dried over MgSO$_4$, filtered and concentrated. The residue was chromatographed on silica gel (hexane–ethyl acetate, 9:1, v/v) to give the olefin 4 (1.4 g, 98%) as a colorless oil. $^1$H NMR (CDCl$_3$) $\delta$ 1.38 (3H, s), 1.41 (3H, s),

(6R)-(2,5-Dimethoxy-4-methylphenyl)-2-methyl-2-heptene (3). A mixture of 4 (350 mg, 0.87 mmol), Na$_2$HPO$_4$ (494 mg, 3.48 mmol) and 5% Na–Hg (1.4 g) in MeOH (7 mL) was sonicated at RT for 6 h. After filtration through a pad of Celite, the mixture was extracted with AcOEt and the extracts washed with water and brine, then dried over MgSO$_4$, filtered and concentrated. The residue was chromatographed on silica gel (hexane–ethyl acetate, 9:1, v/v) to give the olefin 3 (193 mg, 85%) as a colorless oil. [α]$_D$ -34.3$^\circ$ (c 1.57, CHCl$_3$). $^1$H NMR (CDCl$_3$) δ 1.18 (3H, d, J=6.8 Hz), 1.48–1.67 (5H, m), 1.67 (3H, s), 2.20 (3H, s), 3.14 (1H, sextet, J=7.3 Hz), 3.76 (3H, s), 3.78 (3H, s), 5.12 (1H, m), 6.666 (1H, s), 6.6674 (1H, s). $^{13}$C NMR (CDCl$_3$) δ 16.1 (q), 17.6 (q), 21.3 (q), 25.7 (q), 26.4 (t), 31.9 (d), 37.3 (t), 56.1 (q), 56.4 (q), 109.8 (d), 114.4 (d), 124.2 (s), 124.9 (d), 131.1 (s), 134.0 (s), 150.9 (s), 151.9 (s). (R)-(+)–Curcuquinone (1). To a solution of 3 (40 mg, 0.15 mmol) in CH$_3$CN/H$_2$O (7:3, v/v, 0.8 mL) was added (NH$_4$)$_2$Ce(NO$_3$)$_6$ (307 mg, 0.56 mmol) at 0 °C, and the mixture stirred at RT for 10 min. The mixture was extracted with Et$_2$O and the extracts washed with water and brine, then dried over MgSO$_4$, filtered and concentrated. The residue was chromatographed on silica gel (hexane–ethyl acetate, 9:1, v/v) to give (R)-(+)–curcuquinone 1 (20 mg, 56%) as a yellow oil. (R)-(−)–Curcuhydroquinone (2). A solution of 1 (28.2 mg, 0.12 mmol) in THF (0.6 mL) had added a solution of Na$_2$S$_2$O$_4$ (211 mg, 1.20 mmol) in H$_2$O (0.4 mL) at 0 °C, and was stirred at RT for 5 min. The mixture was extracted with Et$_2$O and the extracts washed with brine, dried over MgSO$_4$, filtered and concentrated. The residue was chromatographed on silica gel (hexane–ethyl acetate, 9:1, v/v) to give (R)-(−)–curcuhydroquinone 2 (27.8 mg, 98%) as a colorless oil.
